

basic principles of polymer pdf

This chapter introduces the basic principles in polymer science, illustrates how polymer materials can be specifically designed to meet the needs in the biomaterials

Polymer Nomenclature. As with most areas of science, names associated with reactions, particular chemical and physical tests, etc., were historically derived with few overall guiding principles. Further, the wide diversity of polymer science permitted a wide diversity in naming polymers.

The major alternative type of polymer is formed by condensation polymerization in which a simple molecule is eliminated when two other molecules condense. In most cases the simple molecule is water, but alternatives include ammonia, an alcohol and a variety of simple substances.

Long sequences of simple chemical units interlinked with covalent bonds came into recognition as the basic structural feature for all polymer molecules. The polystyrene molecule produced by polymerization of styrene, $\text{CH}_2 = \text{CH}$, came to be recognized to have the structure $(\text{CH}_2 - \text{CH})_n$, where, n had a large value.

Structure and Properties of Polymers

These comb polymers can be synthesized by polymerization of macromers (a monomer consisting of a polymerizable group linked to a short polymer chain) or by grafting (13). Branched polymers contain branch points (junctions) that connect three or four subchains, which may be side chains or parts of a main chain.

Basic principles of HPLC. 175. The net retention time (t_R) is the difference between total retention time and dead time. That is the time the sample component remains in the stationary phase. The capacity factor k' is a measure of the position of a sample peak in the chromatogram.
